Provides a simple yet powerful menu-based keyboard macro system.KEYMACRO is a freeware that has the sole purpose of serving as a simple yet powerful interface to facilitate the creation and editing of keyboard macro files. Macros are great because they enable you to automate simple and repetitive tasks that can be done much faster and more easily than using the mouse or other keyboard commands. For example, you can enter a series of commands in a macro file and save them so that they can be executed at a later time using the hotkeys assigned to the commands. There are some programs that have a macro editor built-in, but they are usually very limited, with limited features and capabilities, and so are not ideal for creating complex macros. Instead, we developed KEYMACRO so that people can create keyboard macro files from scratch or edit others' macros. With KEYMACRO you can create macros from scratch or modify existing macros. You can also create macros in a format that is easy to edit. In order to create macros you simply drag and drop items from the file or folder windows to the Macro Entry box and it is saved in the ~/.KEYMACRO directory. The ~/.KEYMACRO directory is hidden by default but can be displayed by going to VIEW > SHOW HIDDEN DIRECTORIES in the main window. To edit the macro, you simply double-click a macro in the Macro list and it will open in the Macro Editor window. Macros are added to the list by selecting File > Add Macro and then selecting the macro that you want to add. A default macro, named "MY MODE", is already added. To insert text into the macro, use either the Keyboard Macro or the Text Macro. Keywords or letters can be typed in the Macro Entry box or Text Entry box using the shortcut keys of the keyboard and then a macro can be created that will insert the text into the desired location within a file or in another macro. To create a macro that will convert the file extension from.TXT to.TEX, open the Text Macro, type the desired conversion into the Macro Entry box and click OK. To create a macro that will delete a file, open the File Macro, enter the file name in the Macro Entry box and click OK. When you create a new macro, the New Macro dialog box will appear with the name of the new macro, the macro description, macro location and macro settings as shown in the following figure: Macro settings are what control how 80eaf3aba8

I have a device with a single I/O pin which I'd like to use to read and write data to a USB port, and then get a summary of the data read. The device will run Linux (Red Hat version 5), and I've used the code from this question as my basis for this code: // data structure typedef struct { int *data; unsigned long begin; unsigned long size; } read_s; void *read_thread_main(void *); void read_thread(read_s *read); // main() int main() { read_s read; // create threads read_s read_thread_main; read_thread_main.data = NULL; read_thread_main.begin = 0; read_thread_main.size = 1; pthread_create(&read_thread_main, NULL, read_thread_main, &read); // setup thread pthread_detach(read_thread_main.thread); pthread_join(read_thread_main.thread, NULL); return 0; } // read_thread() void *read_thread_main(void *p) { read_s *read_thread_main = (read_s *)p; read_thread(read_thread_main); return NULL; } void read_thread(read_s *read_thread_main) { int byte_count; // read data into buffer for (byte_count = 0; byte_count size; byte_count
